U.S. Environmental Protection Agency is overseeing the cleanup of lead-contaminated soil in the residential area referred to as Operable Unit 2 of the Pilsen Area Soils site. Contractors from H. Kramer & Co. will begin the work this month in the area bounded by West 18th Place to the north, an alley halfway between South Allport Street and South Racine Avenue to the east, West 21st Street to the south, and South Loomis Street to the west (*See map, Page 2*). The work is being conducted in compliance with U.S. EPA's unilateral order issued to the legally responsible parties on Sept. 22, 2016 to remove lead-contaminated soil from at least 54 residential yards in the target area.

The current schedule calls for work from mid-December through July 2017. After coordinating with property owners, H. Kramer & Co. will begin to dig up yards at a few homes during the week of Dec. 19. However, crews will generally pause work during winter months because freezing temperatures and heavy snowfall can make access to the ground and excavation difficult for workers. The warmer weather next spring will soften the ground and allow H. Kramer to resume cleanup.

Cleanup will consist of excavating contaminated dirt in the yards and gardens of homes with lead in surface soil greater than 400 parts lead per million parts soil. Engineering controls such as dust suppression and monitoring will protect workers and residents. The soil will be disposed of at a permitted disposal facility. Yards will be filled in with clean soil and restored to their original condition as much as possible.

From January through June 2016, U.S. EPA officials and H. Kramer's contractors reached out to OU2 residents and homeowners to get permission to sample their yards and gardens. The sampling was to determine if their surface soil was contaminated with lead. About half the homeowners in OU2 gave permission to have samples collected on their property and cleanup conducted if necessary. If you own a residential property within OU2, U.S. EPA urges you to complete an access agreement allowing the federal Agency to sample your property for soil lead and find out if a cleanup is needed. Please contact Heriberto León or Ramon Mendoza (*see left-hand box*) for more information.

U.S. EPA continues to provide residents with information and advice on how to protect their families from lead:

- Cover any exposed soil with grass, mulch, gravel or pavement.
- Use raised beds or containers only for growing vegetables.
- Prevent children from playing in dirt or mulch.
- Wash children's hands after they play outside.
- Wash children's toys regularly. Wash hands thoroughly before preparing food, eating or drinking.
- Regularly wet mop floors and wet wipe flat surfaces.
- Remove shoes before going inside the home.

About the Pilsen Area Soils site

U.S. EPA has been investigating lead contamination in Chicago's Pilsen neighborhood since 2011 in response to residents' concerns about the area's long industrial history. The federal Agency conducted soil sampling in 2012 and 2013 and found high levels of soil lead collected from two residential areas, as well as from the

alley and railroad spur near the H. Kramer facility. Starting in November 2015, U.S. EPA oversaw the removal of tracks and ties along a railway spur between South Laflin Street and 21st Street and Cermak Road. Workers also excavated and disposed of lead-contaminated soil from the railroad spur and alley behind the foundry on 21st Street. All areas were covered with asphalt or gravel last spring.

This map shows the area in Chicago's Pilsen neighborhood where U.S. EPA would like to sample residential soil for lead levels.
